The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferative disorders. The present method enables highly specific classification of haematopoietic cell proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    30-JUN-2000;

                                                                                                                                                                                                                                                                                  The invention relates to a novel method for detecting and differentiating competitions are colon cell proliferative disorders associated with at least one competition of the method comprises contacting a target concleic acid in a biological sample obtained from the subject with at competition are reagent or a series of reagents, where the reagent or series of reagents, distinguishes between methylated and non methylated CpG dinucleotides within the target nucleic acid. The molecules of the convention demonstrate cytostatic activity whilst the method may useful for detecting and differentiating between colon cell proliferative disorders, including cancers such as colon adenoma and colon carcinoma. The PNA (peptide nucleic acid)-oligomers are useful as probes for determining cytosine methylation state or single nucleotide colon carcinoma. The current sequence is that of the pretreated genomic DNA cregion of the invention. This sequence is not shown within the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                      The invention relates to a method of detecting and differentiating CC between lymphoid cell proliferative disorders associated with at least CC one gene and/or their regulatory regions in a subject by contacting at CC target nucleic acid in a biological sample obtained from the subject with CC at least one reagent or series of reagents that distinguish between CC methylated and non-methylated CG dinucleotides within the target nucleic CC acid. The genes and/or their regulatory regions are preferably selected CC from MDR1, CSNK2B, EGR4, AR, CDK4, RB2, CDC25A, GPIb beta, MYOD1, CDH3, CC MYCL1, ELK1, ABL1, APC, BC12, CDH1, CDKN1A, CDKN1B, CDKN2A, CDKN2B, FOS, CC GSTPD1, HIC-1, MGMT, MLH1, MOS, MYC, PYEN, RB12, TGFBR2, TP73, CDKNIC, CC GSTAbeta, ESR1, APAF1, BAK1, BAX or HOXAS, Oligomers, peptide nucleic caid (PNA)-oligomers and/or isolated nucleic acids based on the sequences CC of the genes are useful for detecting the methylation state of all the CC Godinucleotides within one or more the sequences, or their complements, CC for determining the cytosine methylation state and or single nucleotide CC godinucleotides within one or more the sequences, or their complements, CC conditions such as diffuse large B-cell lymphoma, mantle cell lymphoma, CC chronic lymphocytic leukenia, small lymphocytic lymphoma and follicular CC differentiation between subclasses, diagnosis, prognosis, treating and/or monitoring of lymphoid cell proliferative disorder. This sequence CC above mentioned genes.

The invention relates to a novel method for predicting the responsiveness co of a subject with a cell proliferative disorder of the breast tissues to a therapy comprising analysing the methylation pattern of a target nucleic acid by contacting at least one of the target nucleic acids in a biological sample obtained from the subject prior to or during treatment. The method of the invention has cytostatic activity, and may have a use in gene therapy. The set of oligonucleotides comprising at least two of the oligomers are useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SURs) within the sequences. The methods, nucleic acid, oligonucleotide, and kit are useful for the treatment, characterisation, classification and/or differentiation, of treatment, characterisation, classification and/or differentiation, of predicting the responsiveness of a subject with a cell proliferative disorders. The method is also useful for predicting the responsiveness of a subject with a cell proliferative disorders. The method is also useful for the breast tissues to a therapy. The present sequence is used in the examplification of the breast tissues to a therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Foekens J, n
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Predicting responsiveness of a subject with breast cell proliferative disorder, useful for treating or differentiating breast cell proliferative disorders comprises analyzing methylation pattern of a genomic DNA from the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; SEQ ID NO 596; 104pp; English.

were inserted In to the ZAP express vector unidirectionally in the sense orientation with respect to the lacZ promoter of pBK-CMV. An amplified library was prepared from approximately 3 million primary clones in the lambda ZAP Express vector. In vivo excision was then used to generate individual pBK-CMV phagemid clones for EST sequencing."
                                                                                                                                                                                                                                                                                                                                                                      /note="Tyector: lambda ZAP Express/pBK-CMV; Site_1: Such /note="Tyector: lambda ZAP Express/pBK-CMV; Site_2: XhoI (3' linker primer); The mixed organ cDNA library was generated using the ZAP-CDNA method by Stratagene. First strand cDNA synthesis was primed with a 50 bp linker primer containing an oligo of sequence preceeded by a synthesito XhoI site. 5 prime adaptors were used containing an EcoRI cohesive end. The finished cDNAs were inserted in to the ZAP express vector

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score

Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 10); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBL; Sw:, SWISSERO; Tr:, TREMBL; Mp:, WORNPEP; Information on the WORNPEP database can be found at the longer ac.uk/Projects/Celegans/wormpep Clone-derived Zebrafish pUC subclones occasionally display inconsistency over the length of mononuclectide A/T runs and conserved TA repeats. Where this is found the longest good mality representation will be
